### Expanites outstanding hardening process on high-end titanium watch

The Swiss watch company Horage is about to release a new watch- the 10 years limited edition: The Autark.

When developing the watch, it was very important to Horage that the Autark watch was extremely resistant to wear to protect the watch from scratches that will appear from daily wear.

The solution to the challenge came from Expanite: The superior hardening technology ExpaniteHard-Ti process that makes stainless steel and titanium extremely hard and wear resistant.

“We relatively quickly found that the advantages of the Expanite’s hardening technology was *the* solution to improv wear and scratch resistance on the our Autark watch. Obviously, we therefore have all titanium parts on the Autark watch hardened: Watch -case, -strap and -buckle” says Mr. Andi Felsl.

Horage looks forward to releasing a high-end titanium watch virtually impossible to scratch!
